Civil Capacities in Clinical Neuropsychology George J. Demakis 2012-10-15 Clinical neuropsychologists are increasingly involved in the evaluation of civil capacities and are in demand by other professionals, particularly attorneys and judges, to assist their decision-making about these sometimes complex issues. While there has been some neuropsychological research in this area, this has not been assembled into a single volume nor have practice recommendations been provided. This volume fills these gaps. The first part of this volume reviews and synthesizes the research literature on neuropsychological aspects of civil capacities. The specific capacities addressed include driving, financial and healthcare decision-making, testamentary (i.e., will-making) capacity, and personal care and independence. Each chapter addresses relevant background issues, conceptual/theoretical advances, and empirical findings. The chapters also include an illustrative case study that demonstrates how the authors (each expert in the various areas) evaluated and conceptualized the case. Each chapter is written from an evidence-based perspective and, where appropriate, uses research to inform practice recommendations. The second part of this volume provides recommendations to practitioners on how to conduct civil capacity evaluations that utilize neuropsychological assessment. There are chapters on an evaluative framework for the assessment, capacity test selection and psychometric issues, working with other data sources besides testing (e.g., collateral interviews), best practices in report-writing and testifying, as well as common ethical issues in such cases. Throughout, these chapters provide practical "how to" advice to improve neuropsychological practice and consulting in civil capacity cases. In addition to these chapters, there is a chapter written by legal consumers of psychological reports. This chapter offers a wealth of useful information and recommendations that, if followed, will further serve to advance psychological report-writing and consultation in civil capacity evaluations.

Temporal Stability of the Electronic Version of the Motor-Free Visual Perception Test Third Edition (MVPT-3) Andrea Sparks Eanes 2014 In today's technology based society, children are learning information from digital devices and are currently being tested by paper assessments. New electronic assessments have been created to try to compensate for this discrepancy. However, very few of these electronic assessments have been tested to see if they are a reliable measure. The electronic version of the Motor-Free Visual Perception Test 3rd edition (MVPT-3) is a recently developed assessment that has not been assessed to see if it is a reliable measure. The purpose of this study sought to determine if the electronic version of the MVPT-3 is reliable assessment to use with children ages 4 years 0 months to 10 years 11 months. A test-retest correlational design was used to assess temporal stability. The main research questions reviewed if multiple administrations of the Electronic Version of the MVPT-3 yields consistent outcome scores and if the electronic version of the MVPT-3 is reliable for professionals to use clinically. Fifty-four participants were recruited from four daycare centers and afterschool programs in Eastern and Central North Carolina and ranged in ages 4 years 0 months to 10 years 11 months. Complete data was collected on forty-eight participants and was analyzed via a single tailed Pearson product-moment correlation. The results indicated that the electronic version of the MVPT-3 presents clinically acceptable test-retest reliability with a correlation coefficient of  $r=.81$ . Learning effects were revealed for certain items. Results indicate that this is an appropriate screening assessment for school aged children but should not be used for diagnostic purposes. The results also demonstrate that further and more extensive research needs to be conducted in order to determine if the electronic version of the MVPT-3 is a reliable measure of visual perception.

Visual Perception in School-aged Children Rachel Wood Christian 2010 Visual perceptual skills are often assessed using paper-and-pencil tests such as the Motor-Free Visual Perception Test, 3rd Edition (MVPT-3). A computer-based version of this assessment was independently developed. This study aimed to establish its reliability by comparing scores of 3rd grade children at a local private school on each of the two testing mediums using a test-retest method. A strong correlation of age adjusted raw scores on the two testing mediums were anticipated, which would indicate that the computer-based version of the MVPT-3 is as reliable as the paper-based version. The current study found inconclusive results after correlational analysis, but results showed that 72.5% of participants received clinically comparable results. Clinically comparable results indicate that within the practical settings which this assessment may be utilized, the practitioner administering the assessment would offer similar recommendations. Regarding participants who did not receive clinically comparable results, assessment medium order is associated with incomparable scores. These results support the C-MVPT-III as a reliable and valid tool.

**Orthopedic Care of Patients with Cerebral Palsy** Philip D. Nowicki 2020-06-22 Many of the existing books focusing on the orthopedic management of patients with cerebral palsy encompass only care for the young patient, but this practical text reviews and delineates orthopedic care for patients with cerebral palsy throughout the lifespan. Readers will find a discussion of both non-operative and operative orthopedic management across all ages and functional levels. The text presents a general overview of cerebral palsy, evaluation of patients with cerebral palsy, and procedures commonly used to treat various orthopedic conditions in patients with cerebral palsy. Spasticity management and gait evaluation are likewise highlighted, and surgical chapters cover techniques for the hip, knee, foot and ankle, and spine. It also incorporates chapters focused on issues related to the rehabilitation of patients with cerebral palsy, including bracing, orthotics and other durable medical equipment, physical and occupational therapy, pain management, and adaptive activities and sports, which aim to improve the overall quality of life for patients through the lifespan. Finally, there is a chapter focused on the care transition from childhood to adulthood, an area of importance often neglected in current texts covering patients with cerebral palsy. Whether in the operating room, multi-specialty clinic or private office, *Orthopedic Care of Patients with Cerebral Palsy* will be a go-to resource for orthopedists, pediatricians and all medical professionals caring for this population.
