Parenting Matters National Academies of Sciences, Engineering, and Medicine 2016-11-21 Decades of research have demonstrated that the parent-child dyad and the environment of the family—“which includes all primary caregivers”—are at the foundation of children’s well-being and healthy development. From birth, children are learning and rely on parents and the other caregivers in their lives to protect and care for them. The impact of parents may never be greater than during the earliest years of life, when a child’s brain is rapidly developing and when nearly all of her or his experiences are created and shaped by parents and the family environment. Parents help children build and refine their knowledge and skills, charting a trajectory for their health and well-being during childhood and beyond. The experience of parenting also impacts parents themselves. For instance, parenting can enrich and give focus to parents’ lives; generate stress or calm; and create any number of emotions, including feelings of happiness, sadness, fulfillment, and anger. Parenting of young children today takes place in the context of significant ongoing developments. These include: a rapidly growing body of science on early childhood, increases in funding for programs and services for families, changing demographics of the U.S. population, and greater diversity of family structure. Additionally, parenting is increasingly being shaped by technology and increased access to information about parenting. Parenting Matters identifies parenting knowledge, attitudes, and practices associated with positive developmental outcomes in children ages 0-8; universal/preventive and targeted strategies used in a variety of settings that have been effective with parents of young children and that support the identified knowledge, attitudes, and practices; and barriers to and facilitators for parents’ use of practices that lead to healthy child outcomes as well as their participation in effective programs and services. This report makes recommendations directed at an array of stakeholders, for promoting the wide-scale adoption of effective programs and services for parents and on areas that warrant further research to inform policy and practice. It is meant to serve as a roadmap for the future of parenting policy, research, and practice in the United States.

Childhood Disorders Philip C. Kendall 2000 In Childhood Disorders, Philip C. Kendall provides an up-to-date summary of the current information about the psychological disorders of childhood - their causes, nature and course - together with discussion and evaluation of the major models that guide psychological thinking about the disorders. Drawing on the research literature and case studies from his own clinical work, Kendall describes each of the major childhood disorders. He goes on to give a detailed consideration of the criteria used to make the diagnoses, a presentation of the latest research findings on the nature of the disorder, and an overview of the methods used and evaluations conducted for the treatment of the disorders. Throughout, the range of normal behavioural variations is set as the backdrop against which to make judgements about psychological disorders, and the role of the family in the onset and course of psychological difficulties is explored. Within the coverage of the treatments of childhood disorders, emphasis is placed upon those treatments that have been empirically evaluated and found to be effective in producing beneficial change for the children. In the end, a series of provocative questions are raised and the reader is asked to recognise and think about the personal and social implications of the decisions that we make regarding how we deal with the disorders of childhood. Childhood Disorders will provide an accessible, up-to-date introduction to the field for both students and professionals alike.

Reach Chronicles Daniel Fung 2012-11-05 REACH — an apt and popularly used acronym by many organisations to reflect services that are easily available and for the community. An easy read with a "how-to" intent, this book provides the insights and process of a practical and viable community mental health team. The authors of the book have produced a book which is as close an account to the reality of making the REACH team a value add to the mental wellness of students. This is the first book in Singapore that details the synergy of the various levels of decision making to enable a child and adolescent community mental health team to take shape, allowing hospital staff to reach students and service providers of the primary care levels. REACH Singapore is forward looking and constantly open to improvements and change. Its hope is that as it moves to new heights in service delivery, others would have started to emulate and start their cycle of the life-giving process of community mental health to child and adolescents in their own systems.

The Mental Health of Children and Adolescents Helmut Remschmidt 2007-04-04 Around the world, a vast number of children and adolescents suffer from mental and neurological disorders and only a small proportion of them receive adequate care. This is so in both developing and developed countries. The need to raise awareness about this problem and provide specific advice regarding their prevention and treatment was identified as a priority for the World Psychiatric Association by Professor Ahmed Okasha during his Presidency of the Association and resulted in the creation of his Presidential Programme on Child Mental Health. This book presents some of the fruits of this programme and constitutes a global call to action for mental health workers and policy makers. *The Mental Health of Children and Adolescents: An area of global neglect* brings together information on the burden of mental disorders in childhood and adolescence with methods of raising public awareness of these problems. The book also describes therapeutic and preventive interventions that could diminish them. It then presents the results of field studies in Brazil, Egypt and Russia documenting the effectiveness of interventions to prevent school dropout in those three very different countries. With its emphasis on practical guidance for the development of interventions to prevent or treat child and adolescent mental health, *The Mental Health of Children and Adolescents: An area of global neglect* provides much-needed information of direct interest to health professionals and the many others involved in the provision of health care to children and adolescents in both the developing and the developed countries.

Preventing Bullying Through Science, Policy, and Practice National Academies of Sciences, Engineering, and Medicine 2016-09-14 Bullying has long been tolerated as a rite of passage among children and adolescents. There is an implication that individuals who are bullied must have "asked for" this type of treatment, or deserved it. Sometimes, even the child who is bullied begins to internalize this idea. For many years, there has been a general acceptance and collective shrug when it comes to a child or adolescent with greater social capital or power pushing around a child perceived as subordinate. But bullying is not developmentally appropriate; it should not be considered a normal part of the typical social grouping that occurs throughout a child's life. Although bullying behavior endures through generations, the milieu is changing. Historically, bullying has occurred at school, the physical setting in which most of childhood is centered and the primary source for peer group formation. In recent years, however, the physical setting is not the only place bullying is occurring. Technology allows for an entirely new type of digital electronic aggression, cyberbullying, which takes place through chat rooms, instant messaging, social media, and other forms of digital electronic communication. Composition of peer groups, shifting demographics, changing societal norms, and modern technology are contextual factors that must be considered to understand and effectively react to bullying in the United States. Youth are embedded in multiple contexts and each of these contexts interacts with individual characteristics of youth in ways that either exacerbate or attenuate the association between these individual characteristics and bullying perpetration or victimization. Recognizing that bullying behavior is a major public health problem that demands the concerted and coordinated time and attention of parents, educators and school administrators, health care providers, policy makers, families, and others concerned with the care of children, this report evaluates the state of the science on biological and psychosocial consequences of peer victimization and the risk and protective factors that either increase or decrease peer victimization behavior and consequences.

The impact of these disorders on the social and economic well-being of individuals, families, and societies is large, growing, and underestimated. Despite this burden, these disorders have been systematically neglected, particularly in low- and middle-income countries, with pitifully small contributions to scaling up cost-effective prevention and treatment strategies. Systematically compiling the substantial existing knowledge to address this inequity is the central goal of this volume. This evidence-base can help policy makers in resource-constrained settings as

they prioritize programs and interventions to address these disorders.

Depression in Parents, Parenting, and Children Institute of Medicine 2009-10-28 Depression is a widespread condition affecting approximately 7.5 million parents in the U.S. each year and may be putting at least 15 million children at risk for adverse health outcomes. Based on evidentiary studies, major depression in either parent can interfere with parenting quality and increase the risk of children developing mental, behavioral and social problems. Depression in Parents, Parenting, and Children highlights disparities in the prevalence, identification, treatment, and prevention of parental depression among different sociodemographic populations. It also outlines strategies for effective intervention and identifies the need for a more interdisciplinary approach that takes biological, psychological, behavioral, interpersonal, and social contexts into consideration. A major challenge to the effective management of parental depression is developing a treatment and prevention strategy that can be introduced within a two-generation framework, conducive for parents and their children. Thus far, both the federal and state response to the problem has been fragmented, poorly funded, and lacking proper oversight. This study examines options for widespread implementation of best practices as well as strategies that can be effective in diverse service settings for diverse populations of children and their families. The delivery of adequate screening and successful detection and treatment of a depressive illness and prevention of its effects on parenting and the health of children is a formidable challenge to modern health care systems. This study offers seven solid recommendations designed to increase awareness about and remove barriers to care for both the depressed adult and prevention of effects in the child. The report will be of particular interest to federal health officers, mental and behavioral health providers in diverse parts of health care delivery systems, health policy staff, state legislators, and the general public.

The Psychological Examination of the Child Theodore H. Blau 1991-02-07 Unlike other books on child testing, this one establishes a conceptual framework for psychological evaluation of children. Instead of focusing on the assessment of particular conditions, it deals with what is important to find out about all children, normal and disturbed, and sets forth a standardized means of analysis, the Basic Psychological Examination. Covers practical aspects of the examination, including the interview group, the examination setting, preparing the child, formulating reports and recommendations, and conferring with parents. Comparable in scope and comprehensiveness to a physician's medical exam, the Basic Psychological Examination enables the practitioner to identify virtually anything out of order in a child's development. Practical and boldly original, the text commends itself to educators, researchers and clinicians alike.

An Exploration of Parent Problem Recognition and Help-seeking Behaviors for Child Mental Health Difficulties Monica M. Kruse 2021 Approximately 40% of youth experience psychological problems; however, less than half receive necessary services. Several help-seeking models suggest that for children to receive psychological care parents must: recognize a problem, decide to seek help, and select a service. The parent problem recognition stage has been largely overlooked in the literature and few studies have examined all stages of the process together. The current study aimed to fill gaps in the literature regarding parent problem recognition and explore the help-seeking process for child externalizing problems, anxiety, depression, and sleep difficulties. Data was collected an Amazon's Mechanical Turk. Participants were 219 parents of children ages 7 to 12 who provided information about help-seeking and child mental health symptoms. Rates of accurate parent problem recognition ranged from 37.6% (sleep) to 66.0% (externalizing concerns). Rates of help-seeking in the current study were low ranging from 42.6% (sleep) to 72.7% (depression) even when parents identified a problem for their child. The severity of the child's problem and parent past experience with mental health predicted problem identification and help-seeking across most presenting concerns. Specialty mental health services were underutilized across problem areas with over 70% of parents indicating that they had or would seek help from their pediatrician and less than half indicating that they had or would seek help from a therapist or psychologist. Results support previous findings that child psychological problems are under-recognized and under-treated. Future research and clinical work is needed to close the gap between the need for services and service use.

The Psychology of Childhood Illness Christine Eiser 2011-10-24 The pattern of childhood illness has changed significantly during this century. Many frightening conditions such as polio and tuberculosis have essentially been eradicated. Other conditions that were once fatal have now achieved the status of chronic disorders, for example, leukemia, cancer, and cystic fibrosis. Technological advances which have resulted in the medical treatment of these conditions have, however, created a gamut of psychological problems for the children and their families. Recognition of these problems has lagged behind other advances in pediatric medicine. The emergence of a specialist area of pediatric psychology (Wright, 1975) has largely been responsible for the mushrooming of research in the area. In much early work, the emphasis was on the impact of chronic illness on children and their families. Reactions at times of greatest trauma, especially diagnosis or death, were particularly well documented. Issues relating to day-to-day aspects of child care, involving questions of discipline or protectiveness, have received much less attention. As far as the sick child is concerned, there has been much investigation of academic and intellectual development, as well as of personality changes that might accompany illness.
